

// Problem 3

```
#include <iostream>
#include <string>

using namespace std;

// Person Class
class Person {
protected:
    string name;

public:
    Person(string n) : name(n) {}

    void printName() {
        cout << "Name: " << name << endl;
    }
};

// Student Class
// Inherits from Person to demonstrate OOP Inheritance
class Student : public Person {
private:
    int studentID;

public:
    Student(string n, int id) : Person(n), studentID(id) {}

    void display() {
        printName();
        cout << "ID: " << studentID << endl;
    }
};

int main() {
    Student s1("Henry Danger", 89856);
    s1.display();
    return 0;
}
```
